NASA TECH BRIEF

NASA Headquarters

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

Preparation of Stable Colliodal Dispersions in Fluorinated Liquids

The problem:

It is desirable to separate oil from water by a liquid barrier whose position can be controlled by a magnetic field.

The solution:

Fluorocarbon liquids are immiscible with both water and oils. A colloidal suspension of a magnetic solid (magnetite) in a fluorocarbon liquid can be made with the aid of a fluorinated surfactant. The resulting liquid will not mix with either water or oil and will be affected by a magnetic field.

How it's done:

A stable dispersion is prepared by wet grinding, in a ball mill half-filled with steel balls, from the following three ingredients:

- (1) 1 volume magnetite powder;
- (2) 2.5 volumes hexafluoropropylene oxide (HFPO) polymer carboxylic acid;

$$\begin{array}{c} \operatorname{CF_3} & \operatorname{CF_3} \\ \operatorname{F(CF-CF_2-O)}_n - \operatorname{C} - \operatorname{COOH}, \\ \operatorname{F} \end{array}$$

where n is 15 but may be \geq 12; and

(3) 30 volumes of a fluorinated ether polymer:

$$\begin{array}{c} \operatorname{CF}_{3} & \operatorname{CF}_{3} \\ \operatorname{F(CF} - \operatorname{CF}_{2} - \operatorname{O})_{n} - \begin{array}{c} \operatorname{CF}_{3} \\ \operatorname{C} \\ \operatorname{C} \\ \operatorname{F} \end{array} + \operatorname{H}, \end{array}$$

where n = 3.
